

Destressing drones operations by model-based navigation

Jan Skaloud, Gabriel Laupre, Aman Sharma

2022-12-07

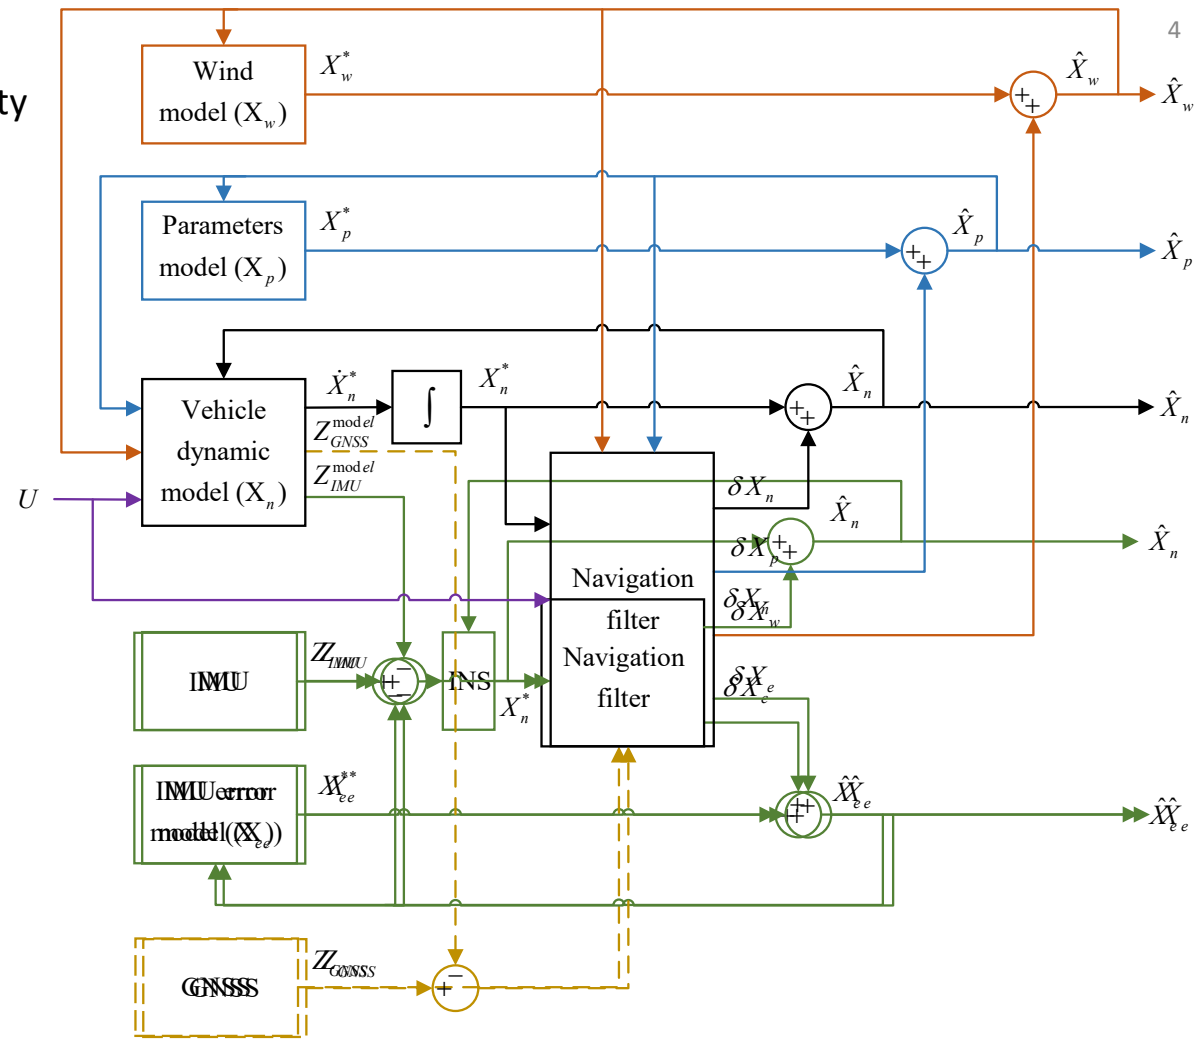

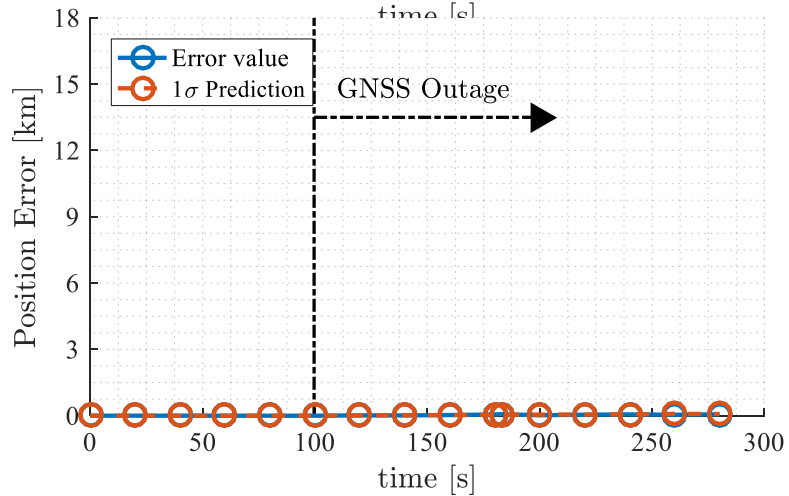

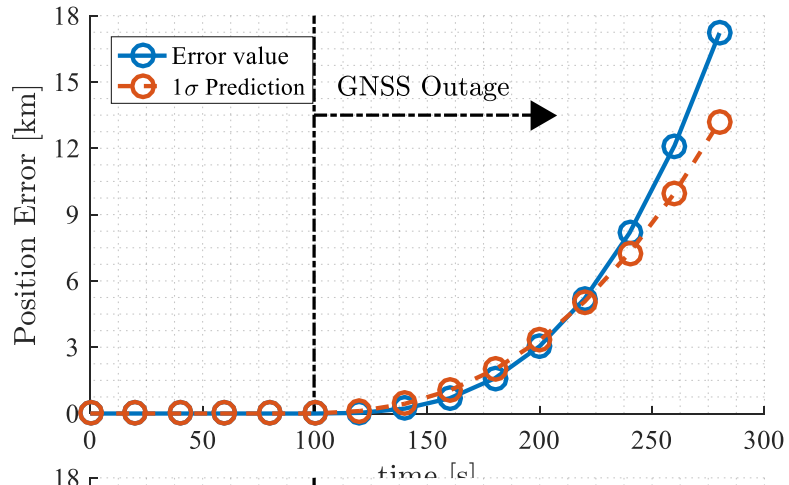

The received GPS signal is 1/10th of 1 millionth of 1 billionth of a Watt.

Agenda

- Background
- Calibration
- Real-time

$t, X(t), P(t)$

Selected contribution < 2020 drone's operation safety

Selected contribution < 2020 drone's operation safety (offline)

Khaghani, Skaloud (2018) Assessment of VDM-based autonomous navigation of a UAV under operational conditions, Robot. & autonom. syst. **EPFL**

- **Q1: Calibration of model coefficients**

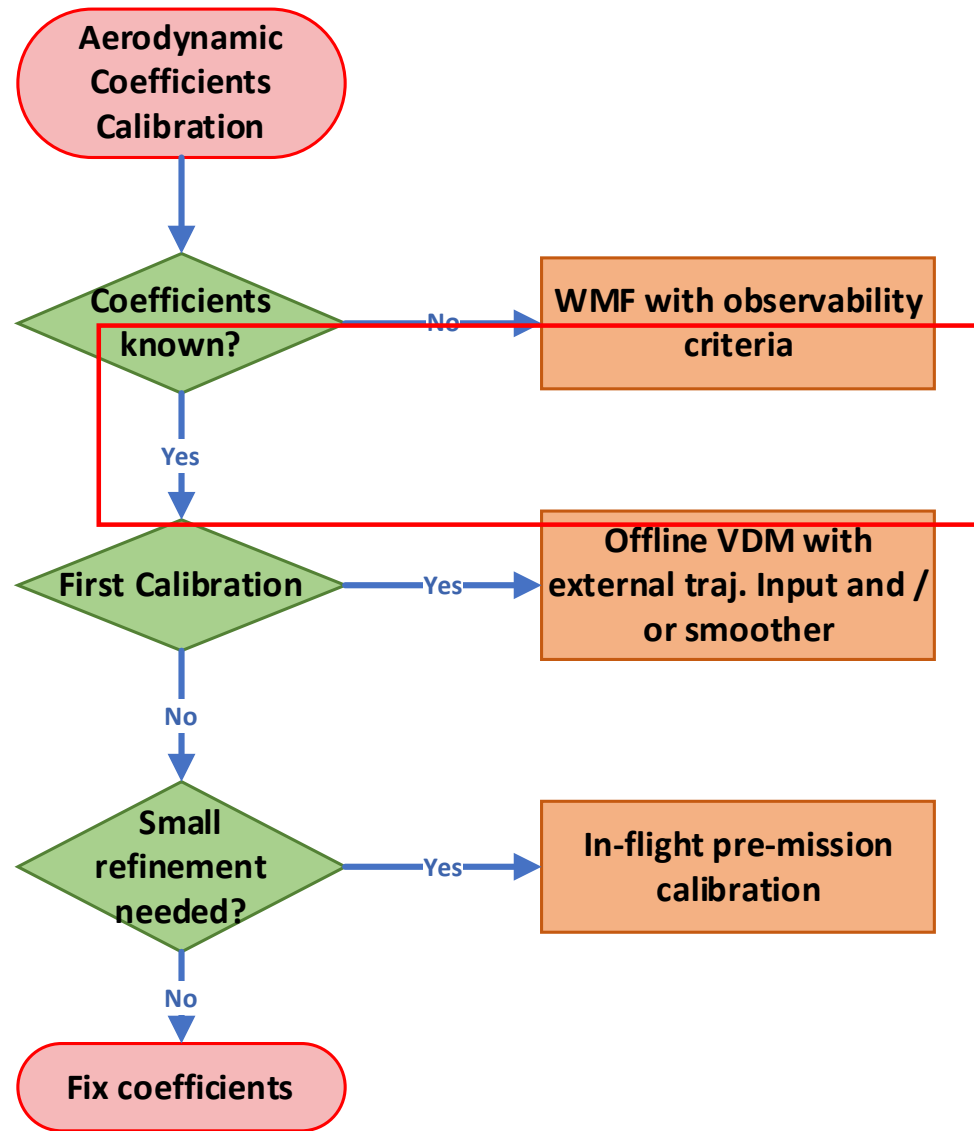

- Without initial knowledge?
- In-flight data only?

- **Q2: Real-time**

- I/O handling (sensors, auto-pilot)?
- Sensor-fusion (speed, observability)?

- **Q3: Performance**

- Autonomous navigation (GNSS outage)?
- Repeatability?

- 0 Calibration w. ZERO priors (per vehicle-type)
 - Input 1: IMU,GNSS, airspeed, ctrl commands
 - Input 2: precise trajectory (INS/PPK-GNSS)

- Estimate

- **W**ind (KF)
- **M**oment coefficients (RLS)
- **F**orce coefficients (RLS)

- Req.

- IMU >\$50,

r ADIS16475 STIM 318

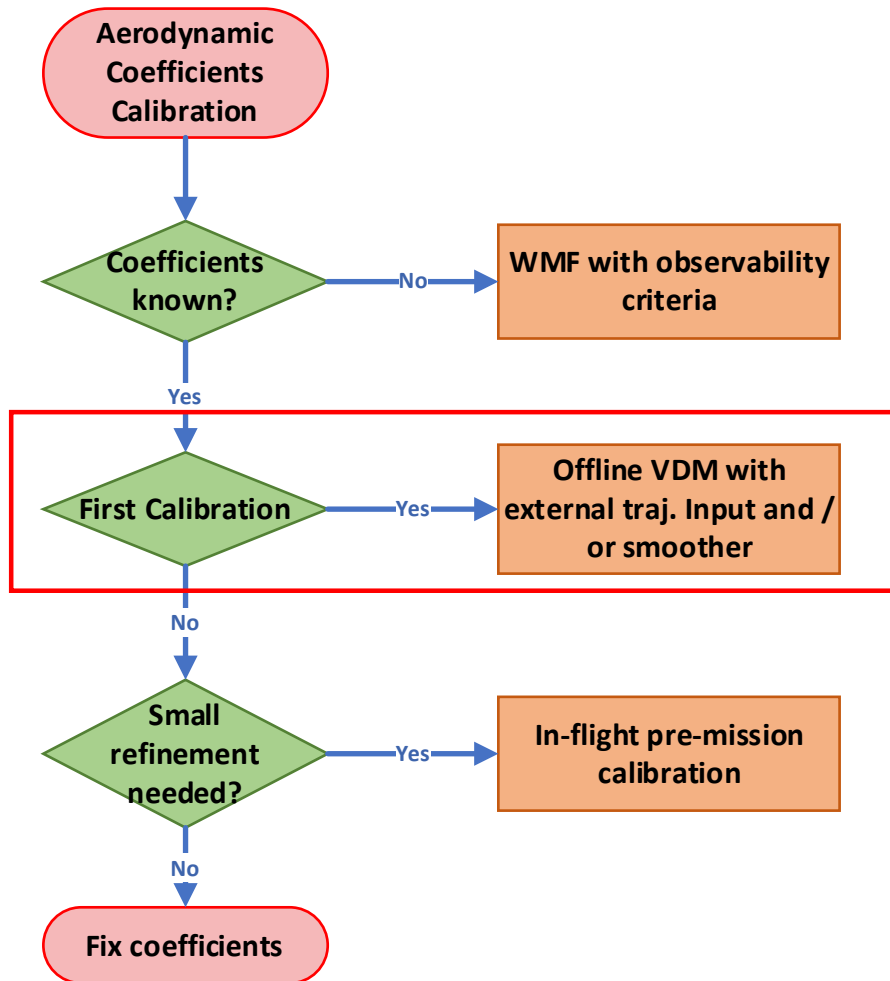

- Challenges
 - Number of unknowns
 - Few % of useful data

	model param No.	
Linear estimators	Reduced	General
1. Wind	4	4
2. Moments	11	20
3. Forces	10	24

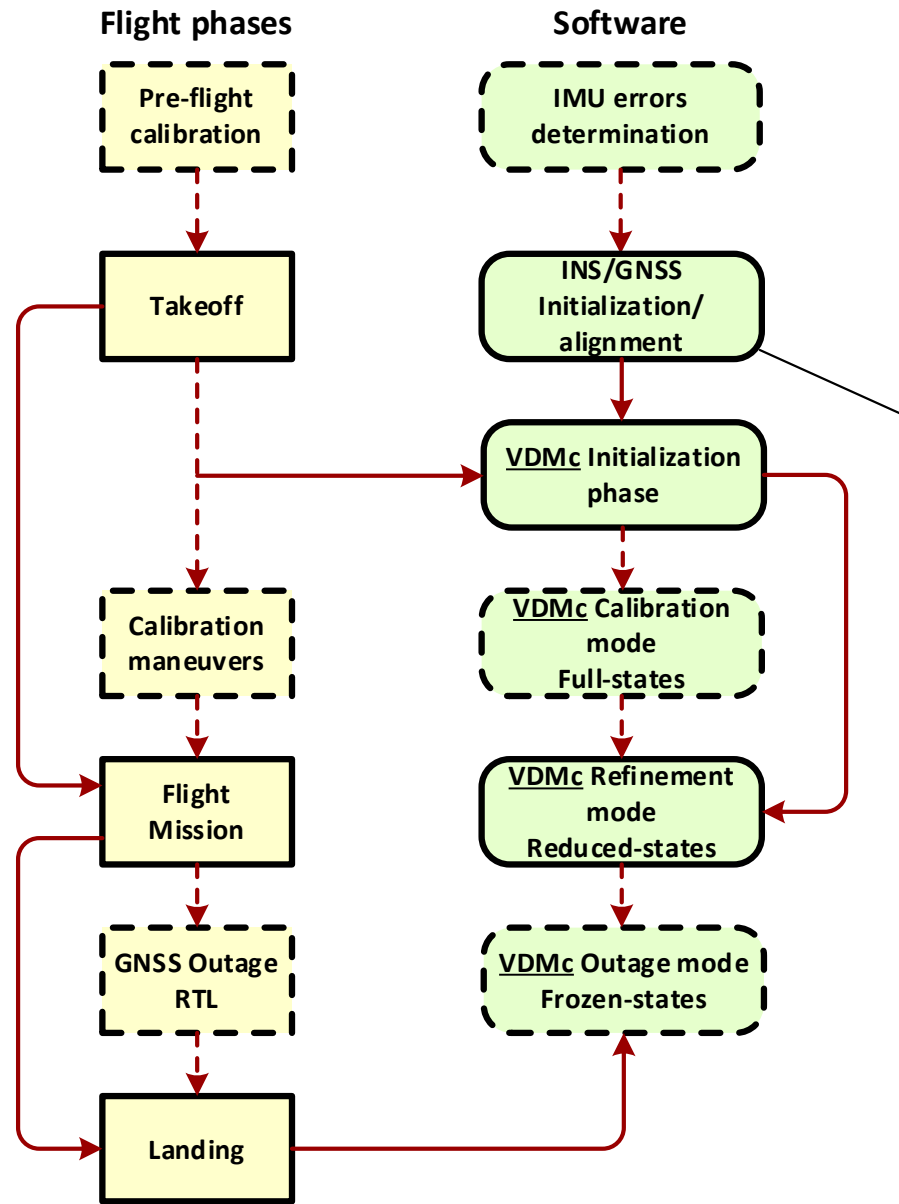

- For each (linear) estimator
 - Evaluate observability Grammian W for each epoch k (recursively)
 - Perform orthogonal decomposition of state-space (new base-vectors)
 - Estimate the states (in the new base) only when observable (partial-update)

- 1st Calibration (per unit)
 - **optimal smoother INS/GNSS**
- P used as a prior

P after smoothing, $IGN8$

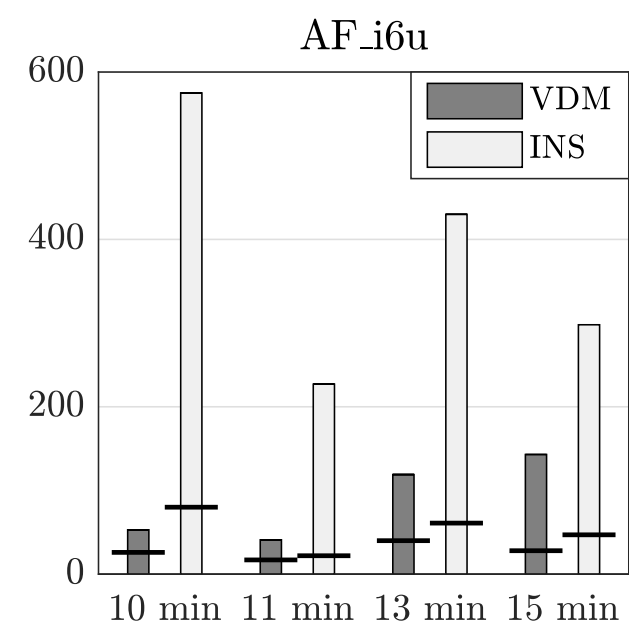

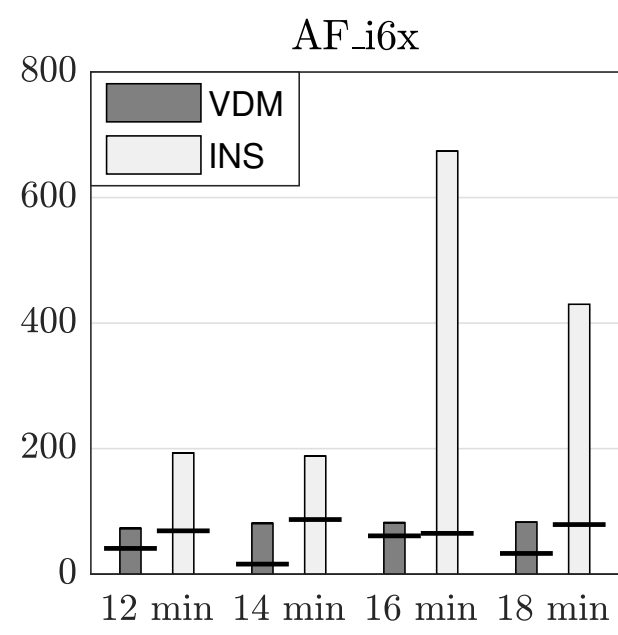

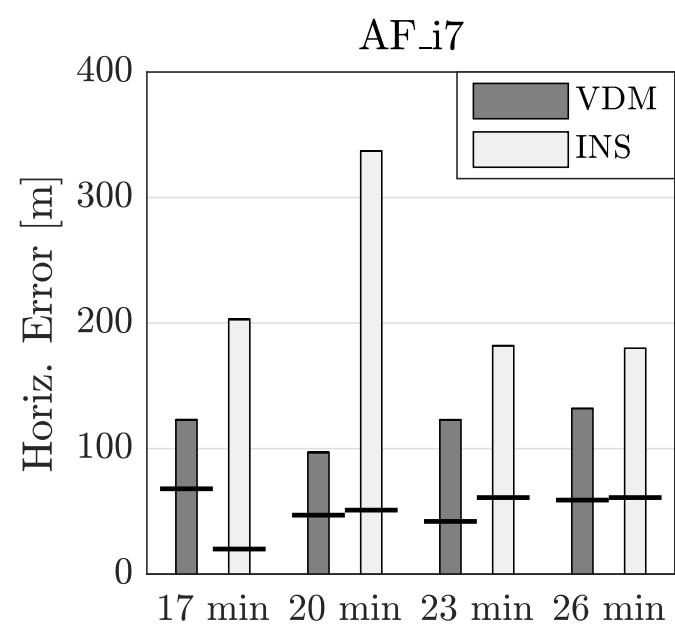

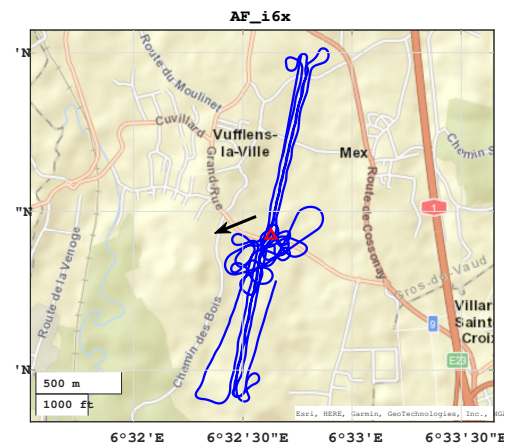

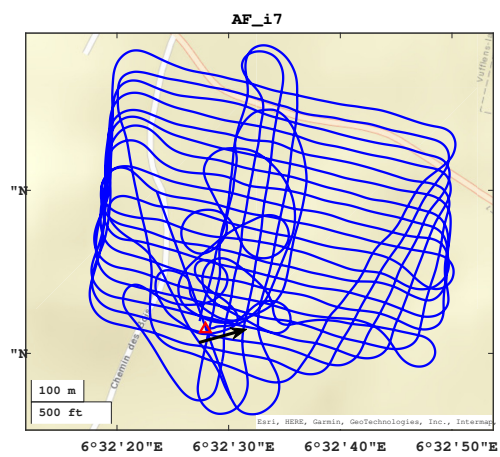

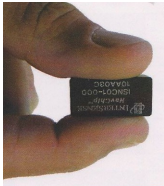

13

Q3

- Improvements factors: VDM-IMU vs. INS

		 ADIS-16475 ~500\$	 NavChip (calibrated) ~600\$	 STIM318 (~6000\$)
GNSS outages (min)	2	2 - 5x	1 - 8x	1 - 3x
	5	-*	>10x	6x
	>5	-*	-*	>10x

Perspectives : model dynamic navigation – platforms & methods

- real-time
- model structure adaptation
- estimation strategies
